

Amendments to the Claims:

The following listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Currently Amended) A fixed-focus projection ~~lens-substantially lens,~~
consisting of ~~six lenses:~~ of:

six lenses, the six lenses including

a single lens having negative refracting power serving as a first lens,
a single lens having positive refracting power serving as a second lens,
a single lens having negative refracting power serving as a third lens,
a compound lens having positive refracting power, consisting of a first
component lens having negative refracting power and a second component lens having
positive refracting power and cemented to the first component lens, and serving as a fourth
lens, and

a single lens having positive refracting power serving as a fifth lens,
the six lenses being arranged in that order from a side of a screen toward a
display device;

wherein a part of the projection lens on the side of the display device is
substantially telecentric, and a surface, on the side of the display device, of the first lens, and
a surface, on the side of the display device, of the second component lens of the fourth lens
~~are aspherical:~~ aspherical,

wherein $0.3 < L_{23}/L_{2-4} < 0.5$, where L_{2-4} is the distance between an end, on the
side of the screen, of the second lens and an end, on the side of the display device, of the
fourth lens, and L_{23} is the distance between an end, on the side of the display device, of the
second lens and an end, on the side of the screen, of the third lens, and

wherein the first, the second and the third lens meet a condition: $-1.5 < f_{1-2}/f_3 < -0.8$, where f_{1-2} is the synthetic focal length of the first and the second lens, and f_3 is the focal length of the third lens.

2-3. (Canceled)

4. (Previously Presented) The fixed-focus projection lens according to claim 1, wherein the first, the second and the third lens have refractive powers such that light rays traveling from the side of the screen and falling on the first lens substantially parallel to an optical axis emerge from the third lens substantially parallel to the optical axis.

5. (Previously Presented) The fixed-focus projection lens according to claim 1, wherein a surface, on the side of the screen, of the first component lens of the fourth lens is substantially flat.

6. (Currently Amended) An optical projector comprising:
an image forming means for forming an image; and
the ~~fixed-focus~~ fixed-focus projection lens according to claim 1 for projecting the image formed by the image forming means.

7-8. (Canceled)

9. (Previously Presented) An optical projector comprising:
an image forming means for forming an image; and
the fixed-focus projection lens according to claim 4 for projecting the image formed by the image forming means.

10. (Previously Presented) An optical projector comprising:
an image forming means for forming an image; and
the fixed-focus projection lens according to claim 5 for projecting the image formed by the image forming means.
